Executive summary

Summary

Evidence-backed assessment of explicitly selected security rules.

Finding status

{"candidate": 0, "confirmed": 0, "rejected": 2, "retest_pending": 0, "retest_verified": 0}

Scope and methodology

Scope

http://127.0.0.1:34205

Method

Explicit rules, source-bound requests and valid controls. Evidence remains local; observations are reviewed at their recorded verification level.

Coverage

No selective retest comparison supplied; no claim of current coverage beyond retained executions.

Workflow variant skip-approval

Finding ID

workflow-63bc959556132746a1e67bce:skip-approval

Status

rejected

Interpretation

satisfied

Controls valid

True

Cleanup

complete

Rule

{"id": "approval", "kind": "forbidden_state", "pointer": "/state", "value": "completed"}

Reason

Independent state probe established the configured transition result.

Workflow trace

3a7cb880e8ba445a6bb31bec8ffe258f35475df779124d1a62157fca7cc1a505

Limitations

Fresh fixture identifiers and independent probes bind the configured object only.
Response bodies are transient; signed state evaluations are attested, not independently replayable from body digests.

Workflow variant skip-approval

Scope

Each cycle retains its original workflow trace and materialized report roots. The shared budget and finite schedule bound this observation period; no future assurance is implied.

Standards profile

API 2023

Limitations and independent verification

Limitation

This is a scoped assessment, not certification or complete ASVS/WSTG/API coverage.

Limitation

Finding status, technical severity and business risk are separate dimensions.

Limitation

A restored configured check is not automatically a verified vulnerability fix.

Limitation

Retest omissions retain not_retested and historical evidence only.

Limitation

Signatures authenticate retained bytes and signing keys; they do not prove remote execution truth.

Limitation

Replayed oracle inputs are approved projections; their relationship to unavailable raw response bytes remains signer-attested.

Limitation

The standalone verifier provides integrity_only; semantic verification requires AuthzLedger and the pinned report renderer.

Verify

Obtain the public-key fingerprint through an independent trusted channel. Run: python3 -I verify_bundle.py PACKAGE --public-key TRUSTED.pem. The package manifest supplies the signer fingerprint. Then run AuthzLedger verify-bundle for retained evidence and exact report semantics. Never trust a key solely because it is inside the package.
